adrien-poirson.dev

Software engineer with over ten years on the front end of data products: analytics dashboards, reporting tools and data explorers for legal, contact-centre, healthcare and research platforms. Most at home in React and TypeScript, and comfortable with Node, Python and databases when a project needs the whole thing. Remote since 2018. I take ownership of what I ship, write plainly, and build every day with AI agents while answering for every line.

SKILLS

Languages	TypeScript, JavaScript, HTML, CSS, Python, PHP
Front end	React, React Native, Next.js, Astro, Redux, GraphQL, styled-components, Tailwind CSS, Storybook
Data and visualization	Victory, react-virtualized, react-window, custom charts and pivot tables, real-time dashboards
Testing	React Testing Library, Playwright, Cypress, Jest
Back end and data	Node.js, Python (Flask), REST APIs, PostgreSQL, MongoDB, Firebase
Tooling and delivery	Git, GitHub Actions, Docker, Webpack, Vite, Netlify, Tailscale, Linux servers
AI	Claude Code, Hermes agent, agent skills and prompting, OpenRouter and open-weight models, Ollama, Whisper, Markdown vaults
Soft skills	Communication, adaptability, collaboration, ownership, problem-solving

EXPERIENCE

Nov 2024 – Present
Vancouver

PolicyReporter `policyreporter.com`

Software Engineer

- Front-end engineering on a healthcare coverage-policy platform: large volumes of structured data, presented so that people find the right part of it quickly.

Jan 2022 – Aug 2024
Austin, TX (remote)

CS Disco `csdisco.com`

Software Engineer, Reporting

- Built Organization Metrics from the ground up: a reporting micro front end that shows customers how their whole organisation uses the platform. Two views (data usage and events), interactive tables with advanced filtering, sorting, search with highlighted results and export. TypeScript, React 17 with hooks, GraphQL, react-window for virtualization.
- Developed a new video player on the HTML5 video element, driven by a small imperative API (useImperativeHandle) so it could evolve without breaking changes.
- Contributed to the in-house UI library built on react-aria, moved older screens from class components to hooks, and made slow pages fast with virtualization and better data fetching.

Sep 2021 – Dec 2021
Vancouver

Global Relay `globalrelay.com`

Front-end Engineer (contract)

- Extended the UI component library of a compliance and archiving platform and refactored legacy screens onto it, for consistency and easier maintenance.

Oct 2017 – Sep 2021
Minneapolis, MN (remote)

Calabrio `calabrio.com`

Principal Front-end Developer

- Led the front end of Data Explorer, a rebuild of a Java and GWT analytics tool in React 16: architecture, library choices, coding standards, code reviews and mentoring as the team grew.
- Shipped customisable dashboards with many chart types, tables and reporting, with Victory, react-virtualized, styled-components and ImmutableJS.
- Engineered a pivot table from scratch on react-virtualized that handles millions of data points: dynamic rendering of hierarchical data with search, filtering and drill-down.
- Created a custom component library on Material UI and styled-components, used across the product.

Jan 2016 – Nov 2017
Vancouver

Cumul8

Front-end Engineer

- Engineered the front end of a data intelligence and IoT platform in React 15, Victory, ImmutableJS and react-virtualized: real-time dashboards and interactive data visualizations.
- Maintained a library of reusable React components, and built a React Native app that brought key features and an alert system to mobile.

Jul 2015 – Nov 2015
Vancouver

Thinkingbox `thinkingbox.com`

Front-end Developer

- Mobile-first marketing sites in React for film releases, among them The Gift and Secret in Their Eyes.

Apr 2014 – Sep 2014
France

JCOMMOPS (now OceanOPS) `ocean-ops.org`

Software Developer

- A data management application for international ocean-observation programmes: a desktop-like interface with custom widgets, dashboards and charts, and a map widget for exploring and downloading geospatial data.

PERSONAL PROJECTS

Ongoing

ScrollUp

A daily learning and practice dashboard with streaks, XP and levels, built to close a specific skill gap in fifteen minutes a day. Content is generated by an agent into an Obsidian-compatible Markdown vault from books, newsletters and videos (Marker, Crawl4AI, yt-dlp and Whisper), every item citing its source. React, Vite, TypeScript, Fastify, PostgreSQL, Drizzle.

2024 – ongoing

My Personal Journal `my-personal-journal.com`

An end-to-end encrypted online journal: AES-256 on the device before anything is saved, encrypted photos, tags, links between entries, search and a bookbound reading view. TypeScript, React, Firebase, Cloud Functions, Playwright, GitHub Actions. Specs in Markdown, tests first and every change through a pipeline, since the first commit.

Ongoing

local-llm-lab

Serving open-weight models myself, Qwen 32B through Ollama on rented GPUs (RunPod, Vast.ai), and benchmarking prompting, quantization and batching trade-offs against the Claude API on quality, latency and cost.

Ongoing

Home server and agents

A self-hosted Linux server running Docker stacks (photos, media, a dashboard, CouchDB sync for the notes vault) behind Tailscale, with nightly restic backups to Backblaze B2 and health checks that alert on Telegram. Operated by Hermes, an open-source agent, which shares one Git repository of skills with Claude Code so a procedure is written once and either agent can run it.

2019 – 2021

Trade Seeds

A trade-planning and review tool built during two years of day trading: React, Python (Flask) and MongoDB, self-hosted.

EDUCATION

Master in Information Systems and Software Development

UT1 Capitole, Toulouse, France

2012 – 2014

LANGUAGES

French (native), English (fluent)

INTERESTS

Kiteboarding, mountain biking, skiing
